C;Complex: type VI collagen is a heterotrimer of one alpha 1(VI) chain (see PIR:CGHUIA)
Sociations among trimer amino- and carboxyl-terminal domains (with disulfide bonds).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A;Note: engineered sequence to allow isolation of the Kunitz-type proteinase inhibitor: R;Arnoux, B.; Merigeau, K.; Saludjian, P.; Norris, F.; Norris, K.; Bjorn, S.; Olsen, O. submitted to the Brookhaven Protein Data Bank, August 1994
A;Reference number: A52812; PDB:IKNT
A;Contents: annotation; X-ray crystallography, 1.6 angstroms, residues 3106-3160
A;Note: engineered sequence expressed in Saccharomyces cerevisiae strain mt-663
C;Comment: Prolines and lysines at the third position of the tripeptide repeating unit sines are 5-hydroxylated and subsequently O-glycosylated.
C;Comment: The fibronectin type III repeat homology domain may be released during proce-

SIMILARITY: Contains 18 fibronectin type-III SIMILARITY: Contains 1 TSP N-terminal (TSPN) SIMILARITY: Contains 4 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IsoId=P13944-2; Sequence=VSP_001148; TISOID SPECIFICITY: Type XII collagen is present in tendons, ligaments, perichondrium, and periosteum, all dense connective tissues containing type I collagen.

DOMAIN: This sequence defines five distinct domains, two triple-helical domains (COL1 and COL2) and three nontriple-helical domains (NC1, NC2, and NC3).

PTW: The triple-helical tail is stabilized by disulfide bonds at another.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Name=Short;

"Complete primary structure of two splice variants of collagen XI
and assignment of alpha i(XII) collagen (COL12A1), alpha i(IX)
collagen (COL9A1), and alpha i(XIX) collagen (COL19A1) to human
chromosome 6q12-q13.";
Genomics 41:236-242(1997).
-i- FUNCTION: Type XII collagen interacts with type I collagen-
containing fibrils, the COL1 domain could be associated with
surface of the fibrils, and the COL2 and NC3 domains may be
localized in the perifibrillar matrix (By similarity).
-i- SUBUNIT: Trimer of identical chains each containing 190 kDa o

PTM: O-glycosylation of isoform Long; glycosaminoglycan of chondroitin-sulfate type (By similarity).

SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.

SIMILARITY: Contains 18 fibronectin type-III domains.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 4 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: The triple-helical tail is stabilized by disulfide bonds at each end (By similarity).

PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TISSUE SPECIFICITY: Found in collagen I-containing tissues: isoform Short and isoform Long appear in amnion, chorion, shousele, small intestine, and in cell culture of dermal fibroblasts, keratinocytes and endothelial cells.                                                                                                                                                                                                      chondroitin-sulfate type (By similarity).

SIMILARITY: Belongs to the fibril-associated collager interrupted helices (FACIT) family.

SIMILARITY: Contains 18 fibronectin type-III domains.

SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.

SIMILARITY: Contains 4 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IsoId=Q60847-4; Sequence=VSP_001150,

WARP is used as a molecular marker, used for detecting a loss of ECM integrity in an animal subject, monitoring repair, regeneration or other disease processes in an animal subject and detecting a disease condition or a propensity for the development of a disease condition in an animal subject. The invention is useful for the manufacture of a medicament in the treatment of a disease condition of the ECM. The disease condition involves the cartilage, and is preferably arthritis. The invention is also used in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Willebrand Factor A-Related Protein polypeptide useful for the manufacture of a medicament in the treatment of a disease condition of the extracellular matrix, in particular arthritis.

                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cr The invention relates to an isolated polynucleotide (I) comprising a concleotide sequence selected from any of 948 sequences (ABZ1119-CR ABZ12066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polynucleotides are useful for cidentifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP69902-ABP6949) are useful as molecular weight complement, for generating antibodies, in medical commarkers, as a food supplement, for generating antibodies, in medical commarkers, as a food supplement, for generating antibodies, in medical compositions are useful as molecular weight compositions are useful as molecular weight compositions are considered and for treating cell-compositions are considered and for treating cell-compositions are diseases (multiple sclerosis, compositions) autoimmune diseases (multiple sclerosis, compositions) genetic disorders, myeloid or lymphoid disorders, liver lung fibrosis, infections (bacterial, viral, fungal, parasitio), compositions, compos

New NOVX polypeptides and nucleic acid molecules useful for preventing treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics. 9

Example ۲, SEQ ID NO 2; 1880pp; English.

The invention relates to a novel isolated polypeptide (NOVX). A CC polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and cc neuroprotective, nootropic, anorectic, antidiabetic, antimicrobial, and cc antilipaemic activity, and may have a use in gene therapy, and as a cc arcive. The polypeptides are encoded by NOVX polymucleotides comprising capetification. The polypeptide is useful in the manufacture of a medicament for treating a syndrome associated with a human disease. The polypeptide, polymucleotide and antibody are useful in diagnosing, creating or preventing NOVX-associated disorders, e.g. cancer, cachexia, Alzheimer's disease, Parkinson's disease, obesity, diabetes, infectious diseases, metabolic syndrome X or dyslipidaemias. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence crepresents a NOVX polypeptide of the invention.

WARP is used as a molecular marker, used for detecting a loss of ECM integrity in an animal subject, monitoring repair, regeneration or other disease processes in an animal subject and detecting a disease condition or a propensity for the development of a disease condition in an animal subject. The invention is useful for the manufacture of a medicament in the treatment of a disease condition of the ECM. The disease condition involves the cartilage, and is preferably arthritis. The invention is also used in gene therapy. The present sequence is mouse WARP protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated Willebrand Factor A-Related Protein polypeptide useful for the manufacture of a medicament in the treatment of a disease condition of the extracellular matrix, in particular arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                 The present sequence represents a kidney injury associated molecule (KIM) CC protein. KIM proteins can be administered therapeutically by expressing CC KIM encoding polynucleotides, to promote growth and/or survival of CC damaged tissue (e.g. renal tissue), since the KIM proteins are upregulated in injured or regenerating (especially renal) tissues. KIM CC fusion proteins, conjugates, antibodies and vectors can also be used CC therapeutically, e.g. these or the KIM proteins may be included with an acceptable carrier in pharmaceutical compositions, useful for therapy/CC prophylaxis of conditions associated with disfunction/disregulation of CC KIM genes or proteins, especially renal diseases or impairments of renal function in humans (e.g. acute renal failure, acute nephritis). The CC polynucleotides can be used to produce antisense sequences which, when CC internalised into cells, can disrupt expression of a cellular KIM gene, also useful in therapy (e.g. to block the growth of tumours dependent on CC KIM for growth) or compositions. The proteins and polynucleotides are CC (indicative of increased risk, or presence of, renal injury or impaired function), or abnormal responses to tissue injury (indicative of increased risk, or presence of, renal injury impaired CC useful diagnostically e.g. to detect and quantify renal injury or impaired condicative of increased risk, or presence of, renal injury impaired tissue of to locate KIM-producing/express to tissue injury (indicative of converted tissue), or abnormal tissue in tissue arising compositions producing cells (especially specific loci, e.g. tissue from/affecting renal tissue), by contacting cells with an imageable KIM-by by contacting cells with an ima
                                                                                                                                                                                                     Query Match
